**3.20)** Suppose the potential  $V_0(\theta)$  at the surface of a sphere is specified, and there is no charge inside or outside the sphere. Show that the charge density on the sphere is given by

$$\sigma_{\theta} = \frac{\epsilon_0}{2R} \sum_{\ell=0}^{\infty} (2\ell + 1)^2 C_{\ell} P_{\ell}(\cos \theta)$$

where

$$C_{\ell} = \int_{0}^{\pi} V_{0}(\theta) P_{\ell}(\cos \theta) \sin \theta \, d\theta$$

In spherical coordinates, the solution to Laplace's equation is given as follows:

$$V(r,\theta) = \sum_{\ell=0}^{\infty} P_{\ell}(\cos \theta) \begin{cases} A_{\ell} r^{\ell} & r \leq R \\ \frac{B_{\ell}}{r^{\ell+1}} & r \geq R \end{cases}$$

We are given the boundary condition  $V(R,\theta) = V_0(\theta)$ , and we know from previous work that  $V_{\rm in} = V_{\rm out}$ . Applying these gives us

$$V_0(\theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} P_{\ell}(\cos \theta) = \sum_{\ell=0}^{\infty} \frac{B_{\ell}}{R^{\ell+1}} P_{\ell}(\cos \theta)$$

From this it is clear that  $B_{\ell} = A_{\ell}R^{2\ell+1}$ . Using the orthogonality of the Legendre polynomials, we see that

$$\int_0^{\pi} V_0(\theta) P_{\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \int_0^{\pi} P_{\ell'}(\cos \theta) P_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \frac{2}{2\ell+1} \delta_{\ell\ell'}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty} A_{\ell} R^{\ell} \delta_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta) = \sum_{\ell=0}^{\infty}$$

Thus

$$A_{\ell} = \frac{2\ell + 1}{2} \frac{1}{R^{\ell}} C_{\ell}$$
$$B_{\ell} = \frac{2\ell + 1}{2} R^{\ell + 1} C_{\ell}$$

where

$$C_{\ell} = \int_{0}^{\pi} V_{0}(\theta) P_{\ell}(\cos \theta) \, \mathrm{d}(\cos \theta)$$

We can solve for the charge density on the surface of the sphere using another boundary condition

$$\sigma(\theta) = -\epsilon_0 \left[ \frac{\partial V_{\text{in}}}{\partial r} - \frac{\partial V_{\text{out}}}{\partial r} \right]_{r=R}$$

$$= -\epsilon_0 \sum_{\ell=0}^{\infty} \left[ -(\ell+1) \frac{B_{\ell}}{R^{\ell+2}} - \ell A_{\ell} R^{\ell-1} \right] P_{\ell}(\cos \theta)$$

$$= \epsilon_0 \sum_{\ell=0}^{\infty} \left[ (\ell+1) \frac{1}{R^{\ell+2}} R^{\ell+1} - \ell \frac{1}{R^{\ell}} R^{\ell-1} \right] \frac{2\ell+1}{2} C_{\ell} P_{\ell}(\cos \theta)$$

giving

$$\sigma(\theta) = \frac{\epsilon_0}{2R} \sum_{\ell=0}^{\infty} (2\ell+1)^2 C_{\ell} P_{\ell}(\cos \theta)$$

**3.25)** Find the potential outside an infinitely long metal pipe, of radius R, placed at right angles to an otherwise uniform electric field  $\vec{\mathbf{E}}_0$ . Find the surface charge induced on the pipe.

The solution to Laplace's equation in cylindrical coordinates (assuming that the problem is invariant under translations in z) is

$$V(s,\phi) = A_0 \ln s + B_0 + \sum_{n=1}^{\infty} (A_n s^n + B_n s^{-n}) (C_n \sin(n\phi) + D_n \cos(n\phi))$$

We choose to point the "uniform" electric field along the x direction such that  $\vec{E} = E_0 \hat{x}$  far away from the pipe. For this problem then, we have two relevant boundary conditions:

- 1.  $V(R, \phi) = 0$  (we are free to choose a valid reference point)
- 2.  $V(s \gg R, \phi) = -E_0 x = -E_0 s \cos \phi$

Note that the constant term from the potential due to the external field is zero since at  $\phi = \pi/2, 3\pi/2$  the potential vanishes. Applying the first boundary condition gives

$$V(R,\phi) = A_0 \ln R + B_0 + \sum_{n=1}^{\infty} \left( A_n R^n + B_n R^{-n} \right) (C_n \sin(n\phi) + D_n \cos(n\phi)) = 0$$

$$\Rightarrow B_0 = -A_0 \ln R \text{ and } B_n = -A_n R^{2n}$$

$$V(r,\phi) = A_0 \ln \left( \frac{s}{R} \right) + \sum_{n=1}^{\infty} \left( s^n + R^{2n} s^{-n} \right) (C_n \sin(n\phi) + D_n \cos(n\phi))$$

Now, applying the second boundary condition we see that  $A_0 = 0$  (since we need the ln behavior to vanish at large s) and  $s^{-n} \to 0$ , leaving us with

$$V(s \gg R, \phi) = \sum_{n=1}^{\infty} \left( C_n s^n \sin(n\phi) + D_n s^n \cos(n\phi) \right) = -E_0 s \cos \phi$$

Matching terms we get that  $C_n = 0$ ,  $D_1 = -E_0$ , and  $D_{n \neq 1} = 0$ . This gives us

$$V(s,\phi) = E_0 \cos \theta \left(\frac{R^2}{s} - s\right)$$

Finally, we can find the surface charge density as

$$\left| \sigma(\phi) = -\epsilon_0 \frac{\partial V}{\partial s} \right|_{s=R} = 2\epsilon_0 E_0 \cos \phi$$
